Activity

Accepting HTTP requests without an upper bound on their content length exposes the application to Denial of Service (DoS) attacks. An attacker can send arbitrarily large requests that exhaust server memory, disk space, or processing capacity before the application can reject them. This rule detects when no maximum content length is configured, or when the configured limit exceeds the recommended thresholds (8 MB for file uploads, 2 MB for other requests).

What is the potential impact?

Denial of Service

An attacker who can send oversized HTTP requests can exhaust server resources—memory, CPU threads, or network bandwidth—causing the application to slow down or become completely unavailable. Even a single large upload can tie up a worker process and prevent other users from being served.
